IMPRONTA MODELS & TALENT

Full Platform Architecture, UX, Data Model, and Delivery Blueprint

Developer-ready master document for building the web app from scratch with phased delivery, scalable architecture, and premium UX standards.

Project	Impronta Models & Talent
Recommended stack	Next.js App Router + Postgres + Auth.js + object storage + custom dashboards
Primary locales	English, Spanish (Portuguese/French/Italian ready)
Document purpose	Single source of truth for product, architecture, UX, phases, and implementation

Prepared from the complete brainstorming workstream in this chat, with current framework recommendations cross-checked against official documentation for Next.js App Router, authentication guidance, and object storage/image delivery patterns.

1. Executive Summary

Impronta Models & Talent should be built as a premium talent discovery and agency operations platform, not as a simple listing website. The public experience must help clients find, save, and request talent quickly. The back office must let the agency control profile quality, media, taxonomy, collections, inquiries, visibility, and future monetization.

- **What it is:** A luxury-agency web app for discovering models, hostesses, entertainers, and talent, supported by structured AI-ready search and agency-managed workflows.
- **What it is not:** Not a generic WordPress directory, not a basic marketplace, and not a chat-only search interface.
- **Core business model now:** Free listings and agency-managed inquiries.
- **Core business model later:** Manual membership tiers now; future paid subscriptions, premium visibility, and private client access later without re-architecting the system.
- **Main UX promise:** Search naturally, filter fast, save talent, contact the agency, and keep a request history.

2. Product Goals

- Make discovery feel premium, fast, and intelligent on both mobile and desktop.
- Keep all client inquiries under agency control; talent should not receive direct client contact.
- Support admin-created profiles, talent self-service, client dashboards, and guest-to-client conversion.
- Use structured data so the platform is searchable, scalable, multilingual, and AI-readable.
- Support strong media workflows: crop, reorder, approve, preview, watermark, optimize, and cache.
- Make future phases possible without rewriting the core: memberships, private talent, map views, advanced analytics, AI ranking, and client premium access.

3. Guiding Product Principles

- Beauty and operational clarity must coexist.
- Structured taxonomy is the source of truth; AI sits on top of that structure.
- Super Admin has full control over every workflow and record.
- Agency Staff uses the same admin system with permission-based restrictions.
- Talent and Client dashboards should be simpler, cleaner, and helper-driven.
- Every important user action should have helpers, validation, success messaging, and save-for-later support.
- Architecture must separate account identity from the business objects it controls (especially talent profiles).

4. Final Architecture Decisions

Area	Decision
Frontend	Next.js App Router with route groups, nested layouts, Server Components where beneficial, and client components only where interaction demands it.
Auth	Google one-click login + email/password; first-login role selection for public users; Auth.js-based auth layer recommended.
Database	Postgres as the primary relational source of truth.
Storage	Object storage for originals and generated derivatives; watermark-ready public variants.
Media pipeline	Original upload + crop + generated responsive variants + optional watermark on public versions only.
Dashboards	Custom application dashboards inside the app; full-width, app-shell UX, mobile-first but desktop-strong.
Search	Faceted search + AI query interpretation + admin/global search kept separate internally.
Inquiry model	Agency-controlled inquiry object stored in the database first, then sync/integrate outward later.
Membership	Manual listing tiers only in V1: Free, Free Trial, Premium, Featured. No payment gateway in V1.
Content management	Reusable section-based homepage and collection management in admin.
Internationalization	English and Spanish first-class from day one; Portuguese, French, and Italian ready.

5. User Types, Roles, and Permission Model

The system needs both role-based access and permission flags. Role names alone are not enough once the agency starts delegating work.

Role	Primary purpose	Can create/edit	Cannot do by default
Super Admin	Global owner/operator	Everything: profiles, media, fields, taxonomy, homepage, collections, inquiries, settings, preview, order, feature,	Nothing

		archive	
Agency Staff	Operational partner	Talent profiles, media, inquiries, selected content modules, preview, approvals if allowed	Deep settings, global field architecture, role architecture unless granted
Talent	Own profile management	Own profile, own portfolio, own preview, save for later, submit for review	Cannot publish self, cannot receive direct client contact
Client	Discovery and request management	Saved talent, requests, client/business info	Cannot see direct talent contact
Guest session	Low-friction discovery	Browse, favorite, use inquiry cart, submit guest request	No persistent dashboard until converted/linked

Recommended permission flags include can_edit_profiles, can_manage_media, can_manage_inquiries, can_manage_fields, can_manage_pages, can_manage_homepage_sections, can_manage_collections, can_view_reports, can_manage_featured_order, can_approve_profiles, and can_view_private_talent.

6. Authentication, Registration, and Onboarding

- Public authentication options: Continue with Google, Sign up with Email, Login with Email.
- Public users choose their role after first successful authentication: I am Talent or I am a Client.
- Admin/Staff roles are never publicly selectable.
- Registration must be fast; full profile completion happens after account creation inside the dashboard.
- Guest discovery must work without authentication via session/cookie/local storage.
- Favorites and inquiry state should merge into a client account later when the guest registers or logs in.

Flow	Recommended behavior
Guest browsing	Can browse, use AI search, favorite talent, open quick preview, and submit a guest inquiry.
Google login	One-click auth first; if role is missing, redirect to role-selection screen.
Talent onboarding	Account created -> choose Talent -> enter dashboard -> complete profile -> accept terms -> Submit for Review.
Client onboarding	Account created -> choose Client -> enter dashboard -> save talent -> optional company info -> request history.

Admin-created talent	Admin can create a talent profile before a login account is claimed; email can be attached later and invite sent later.
Claim flow	Profile can exist first; owner account can be linked later via invite or reset-link flow.

Important implementation rule: user account and talent profile must be separate objects. A talent profile may exist before a user account is claimed.

7. Status, Visibility, Feature, and Ranking Model

Workflow state, visibility, membership, and merchandising must be modeled separately. Do not collapse them into one status field.

Dimension	Allowed values / notes
Profile workflow status	Draft, Submitted, Under Review, Approved, Hidden, Archived
Account status	Registered, Onboarding, Active, Suspended
Membership tier	Free, Free Trial, Premium, Featured (manual in V1)
Membership status	Active, Inactive, Pending, Expired, Manual Override
Visibility	Public, Hidden, Private (private talent feature can be enabled later)
Featured controls	is_featured boolean + featured_level numeric + featured_position manual order + featured_until later
Ranking support fields	created_at, updated_at, listing_started_at, profile_completeness_score, manual_rank_override later

Featured is a merchandising property, not a workflow state. Use featured_level (for example 1-10) and featured_position to guarantee stable ordering across directory sections and collections.

8. Dashboard System Architecture

All dashboards should use a full-width responsive app shell. The exact visual layout should be solved by the developer, but the product requirements and content blocks below should be treated as mandatory.

- Full-width application workspace; never a boxed website page pretending to be a dashboard.
- Mobile-first, but equally strong on desktop.

- Strong helper UX everywhere: inline help, validation, completion feedback, success messaging, empty states, and status explanations.
- Preview buttons must exist for both talent users and admins.
- Use a consistent design system across cards, filters, tables, forms, modals, drawers, notifications, and media grids.

Dashboard	Core modules
Super Admin	Overview, Talent, Talent Detail, Clients, Inquiries, Media, Fields, Taxonomy, Collections, Homepage, Pages, Profile Rules, Analytics, Search Insights, AI Matching, Staff, Activity Log, Settings
Agency Staff	Permission-scoped admin modules: Talent, Media, Inquiries, Clients, Preview, selected content modules, optional approvals
Talent	Overview, Completion, My Profile, Portfolio/Media, Public Preview, Status & Guidance, Notifications, Account Settings
Client	Saved Talent, Requests, Client/Business Info, Profile Settings, later premium/private access

9. Super Admin Dashboard Blueprint

This is the operational control center. It should answer what needs attention, what changed, and what the agency should act on now.

- Top KPI row: Total Talent, Pending Approval, Incomplete Profiles, New Inquiries, Active Clients, Profiles Missing Media.
- Priority action panel: profiles missing photo/cover, low completion, pending revisions, new inquiries, media moderation queue.
- Recent activity feed: profile edits, media uploads, approvals, collection changes, homepage changes, inquiry submissions.
- Quick action entry points: Add Talent, Add Client, Add Staff, Review Pending Talent, Manage Media, Edit Homepage, View AI Search Logs.
- Talent list with saved views: All, Pending, Approved, Featured, Hidden, Missing Photo, Missing Cover, Missing Portfolio, Recently Updated, Needs Review.
- Talent detail tabs: Overview, Basic Info, Roles & Tags, Portfolio/Media, Profile Preview, AI/Matching, Notes, Activity Log.
- Admin quick actions: Save, Save & Preview, Preview Profile, Open Media, Approve, Hide, Archive, Adjust Featured Order.

10. Talent Dashboard Blueprint

- Top card shows Profile Completion with color-coded status and a missing-items checklist.
- Autosave and explicit Save for Later must be supported.
- Profile can be submitted for review when completion threshold is reached; start with 50% minimum, but weight critical fields heavily.
- Dashboard sections should focus on clarity: Basic Info, Talent Type, Bio, Languages, Skills, Availability, Media, Preview, Status & Guidance.
- Profile edits by the talent should create a pending revision; approved/live data should remain public until admin approves the revision.
- Talent can preview draft or pending versions of the public profile.

11. Client Dashboard Blueprint

- Primary modules: Saved Talent, Requests, Business/Client Information, Contact Preferences.
- Request history should show selected talent, date, request summary, and status.
- Guest inquiry history should be linkable into a real client account later.
- Future-ready for premium/private-talent access, but not required in V1.

12. Taxonomy, Field System, and Seed Data

The platform should never launch with an empty taxonomy. Seed the database so the UI, AI search, and filters are usable from day one. All business taxonomies should be editable and archivable in admin.

- Taxonomy types: Talent Type, Tags, Skills, Event Types, Industries, Fit Labels, Languages, Locations, controlled field options (hair color, eye color, availability, etc.).
- Protected system taxonomies: workflow statuses, visibility states, membership tiers, certain internal signals.
- Business taxonomies: roles/talent types, tags, skills, industries, event types, fit labels, locations, languages.
- Support aliases/synonyms for AI parsing and multilingual use.

Seed set	Examples / count guidance
Talent Type	Model, Hostess, Promotional Model, Brand Ambassador, Actress, Actor, Dancer, Singer, DJ, Entertainer, Presenter, Content Creator, VIP Hostess, Event Staff; plus modeling subtypes
Tags	Professional, Charismatic, Luxury, Elegant, Commercial Look, Editorial Look, Beach Look, Sales Experience, Event Experience, Hotel Experience, Nightlife Experience, Bilingual, Multilingual, Riviera Maya Based

Event Types	Hotel Activation, Resort Event, Brand Promotion, Product Launch, Corporate Event, VIP Event, Beach Club Event, Nightclub Event, Festival, Photoshoot, Fashion Show, Social Media Campaign, Tasting Event
Industries	Hospitality, Hotels & Resorts, Nightlife, Food & Beverage, Luxury Brands, Fashion, Beauty, Fitness & Wellness, Real Estate, Tourism, Events & Entertainment, Corporate, Retail
Skills	Acting, Dancing, Singing, Modeling, Hosting, Presenting, Crowd Engagement, Guest Relations, Event Hosting, VIP Hosting, Promotions, Brand Activation, Product Demonstration, Sales, Lead Generation
Fit Labels	Best for Hotel Events, Best for Brand Promotions, Best for Luxury Activations, Best for Nightlife Events, Best for VIP Hosting, Best for Fashion Shoots, Best for Resort Entertainment, Best for Product Launches
Languages	English, Spanish, Portuguese, French, Italian, German, Hebrew, Russian, Ukrainian
Locations	Structured location records, not free text. Start with global autocomplete and city/country normalization.

13. Talent Profile Schema

Each profile field should carry metadata: label, slug, input type, applies to entity, required/recommended, public/internal, filterable, searchable, AI-visible, card-visible, profile-visible, help text, validation, sort order, and edit permissions.

Section	Core fields
Basic Information	First Name, Last Name, Display Name, Profile Code, Public Slug Part, City/Base Location, Country, Short Bio, Gender optional, Height, Language summary
Talent Classification	Primary Talent Type, Secondary Talent Types, Talent Categories, Tags, Industries Worked In, Event Suitability, Fit Labels
Physical / Visual	Height, Hair Color, Eye Color, Body Type optional, Measurements optional
Languages & Skills	Languages, Proficiency later, Skills, Special Skills
Experience	Experience Level, Years Experience, Worked With Brands, Professional Highlights

Availability & Mobility	Currently Available, Available For, Willing To Travel, Based in Multiple Cities later
Media	Profile Photo, Cover Banner, Portfolio Images, Video Reel later, Media Categories
Social & External	Instagram, TikTok, Website, External links as needed
Internal / Admin	Workflow Status, Membership Tier, Membership Status, Visibility, Assigned Manager, Internal Notes, Verified flag, Featured controls, Private-talent controls later

Suggested submission threshold: allow Submit for Review at 50% completion, but heavily weight critical fields like display name, location, talent type, bio, profile photo, languages, and portfolio. Save for Later must be available at any time.

14. Directory UX Blueprint

The directory should feel like a luxury-agency discovery experience with SaaS-level clarity. Use cards, a sticky filter sidebar on desktop, a mobile filter drawer, and a persistent AI search bar at the top.

- Desktop layout: AI search + controls at top, left sticky filter rail, right full-width results grid.
- Mobile layout: AI search top, expandable filter drawer, sticky bottom inquiry cart, one-column or compact two-column card strategy as appropriate.
- Use infinite loading on the frontend, backed by paginated APIs. Include a Load More fallback if helpful for reliability/accessibility.
- Keep card content simple: image, display name, talent type, location, height, language summary, 1-2 fit labels, Save, Quick Preview, View Profile.
- Do not overload cards with many badges or decorative chips.
- Include a top-right sort control.
- Applied filters should appear as removable chips above results.

Directory sort options	Definition
Recommended	Blend of fit relevance, featured ranking, profile completeness, quality signals, and business rules
Featured	Featured first, then higher featured_level, then featured_position
Recently Added	Newest created_at
Recently Updated	Newest updated_at
Longest Listed	Oldest listing_started_at

A-Z	Display name alphabetical

15. Talent Card, Save List, and Inquiry Cart

The Save action is the main conversion mechanic. Internally it is a favorites system; publicly, use more polished language like Save or Add to My List.

- Card top-right action: Save.
- Quick Preview opens a polished portfolio/lightbox modal with larger image, summary, and CTA to open full profile.
- A floating inquiry cart appears when talent is saved. Desktop: bottom-right floating panel. Mobile: sticky bottom bar.
- When one or more talent are saved, show CTAs like Contact About These and View Saved.
- Favorites should work for guests using session/cookie/local storage and later merge into a client account.

Inquiry cart field	Behavior
Saved talent list	Shows selected talent names and count
Contact modal	Name, Email, Phone, Event Type, Date, Location, Message, selected talent summary
WhatsApp CTA	Auto-compose a message including selected talent and optional event details
Storage	Persist inquiry and saved-talent context in the database; treat guest as a lightweight client session
Agency routing	All inquiries go to agency only

16. Homepage UX Blueprint

- Homepage and discovery should be combined, not split into separate disconnected experiences.
- Hero section: large AI search with subtle typed-example transitions that stop when the user focuses the input.
- Main content order: Hero Search, Talent Type shortcuts, Featured Talent, Best For sections, Explore by Location map, New Talent, How It Works, CTA.
- Homepage sections must be admin-managed and reorderable.
- Tone: black + gold luxury agency, but with modern product clarity.

17. AI Search System

AI search should be a natural-language discovery layer over structured taxonomy, not a replacement for the taxonomy. V1 should prioritize intent parsing and filter synchronization over full conversational complexity.

- Entry points: homepage hero search and persistent directory search bar. Floating AI assistant can come later.
- Interpret user requests into talent type, location, languages, event type, fit/use case, quantity, timing/availability, style/traits, skills, and industry context.
- Render AI output as applied filter chips, ranked result cards, and concise suggestion text.
- Keep AI search and manual filters synchronized both ways.
- Store raw AI query and interpreted query with inquiry records whenever possible.
- Support multilingual prompts and synonym mapping from day one.

AI build phase	What to implement
Phase 1	Structured intent parser using taxonomy, aliases, rules, and keyword mapping
Phase 2	Semantic enhancement (embeddings/vector search) if needed for richer matching
Phase 3	Conversational assistant or floating guide, only after search fundamentals work

18. Public Talent Profile Page

The public profile should feel editorial and premium without abandoning product clarity.

- Wide cover banner at the top; profile image overlaps the lower edge of the banner slightly.
- Header area should include display name, talent type, location, language summary, Save / Add to My List, and Contact About This Talent.
- Featured portfolio media should appear high on the page, with one stronger lead image and supporting gallery below in a magazine-style layout.
- Organize details cleanly: Best For, About, Skills, Languages, Experience, Availability/Travel if shown, and additional gallery assets.
- Keep repeated conversion paths down the page: Save This Talent, Browse More Talent, Contact Impronta.
- Admin and Talent must both be able to preview the public profile, including draft and pending states.

19. Media Ownership, Uploads, Crop, Approval, and Watermarking

Media belongs to the talent profile, not to the user who uploaded it. This is critical because admins and staff will upload on behalf of talent.

Rule	Implementation
Ownership	Store owner_profile_id and uploaded_by_user_id separately
Avatar crop	Fixed 1:1 crop with live cropper, move/zoom controls, preview, save confirmation
Banner crop	Fixed wide crop preset for profile header with live cropper and preview
Portfolio order	Drag-and-drop with persistent sort_order; admin can always reorder
Approval	Talent-submitted media changes create pending revisions; admin/staff uploads are auto-approved immediately
Variants	Generate optimized card, gallery, banner, and lightbox derivatives
Watermarking	Admin uploads watermark PNG in settings; apply watermark only to generated public variants, not originals
Media metadata	Type, role in profile, dimensions, file size, crop data, approval state, notes optional

Admin media settings should support watermark enabled/disabled, watermark PNG upload, opacity, position, scale, and target media type/variant controls.

20. Location System, Map Discovery, and Geolocation

- Use structured location records with city, country, slug, display name, and coordinates/centroid as needed. Do not rely on free-text locations.
- Public map should show city/service-area aggregation rather than one pin per talent.
- Use count-based city markers or branded hotspots: for example, Playa del Carmen — 10 talent.
- Clicking a location on the map filters the directory to that location.
- Autocomplete for city and country should be global from day one.
- Future-ready support for near-me search, browser geolocation, and radius filtering (for example within 100 km).

21. Collections, Merchandising, and Ordering

- Collections are curated talent groupings such as Featured Talent, Best for Hotel Events, New Faces, Riviera Maya Talent, or Premium Hostesses.
- Each collection must support manual item ordering.
- Featured priority and collection item order should both be first-class controls.
- Collections can be surfaced on the homepage, directory modules, landing pages, or client views later.

22. Inquiry System and CRM-Lite Foundation

All requests must be stored in the application's own database first, then optionally synced elsewhere later (Notion, Airtable, WhatsApp workflow, email automation, etc.).

Inquiry field	Examples / notes
Identity	inquiry_id, guest_session_id or client_user_id
Selected talent	one-to-many relation to requested talent profiles
Discovery context	source page, raw AI query, interpreted query, applied filters
Contact details	name, email, phone, company/business info
Event details	event type, date, location, quantity, message
Operations	assigned staff, status, notes, timestamps
Status flow	New, Reviewing, Waiting for Client, Talent Suggested, In Progress, Closed, Archived

23. Notification System

- V1 should include in-app notifications with bell icon, unread counts, and event list.
- Notification channels should be configurable so email can be enabled later or selectively now.
- Admin notifications: new talent submitted, pending revision, new inquiry, new media uploaded.
- Talent notifications: profile approved, changes requested, profile incomplete, media rejected.
- Client notifications: inquiry received, request updated, premium/private access later.
- Design the event system so email, WhatsApp, and push can be added later without re-architecting.

24. SEO, AI-Readable Structure, and Multilingual Architecture

This platform needs modern search readiness, not only classic SEO. The site should be built to be understood by search engines, internal AI, and future machine-readable discovery systems.

- Canonical profile URL should include the internal profile code plus readable slug, e.g. /talent/TAL-00023-sofia-m.
- Editable meta title, meta description, social image, canonical rules, and noindex controls should exist for important pages.
- Do not let random filter combinations create junk SEO pages. Keep only intentional pages indexable.
- Use clear semantic page structure and stable entity IDs so AI systems can understand profile entities cleanly.
- Internationalization must be built in from the start: English and Spanish first-class, additional locales extendable later.
- Manual language switcher is required; do not rely only on browser detection.
- Taxonomy and search aliases should support multilingual synonyms (for example hostess / anfitriona / promotional model / modelo promocional).
- Profile free-text fields can remain in the user's original language at first; translated editorial layers can be added later.

25. Core Entity Map

Entity	Purpose / notes
users	Auth identities, roles, login provider, account status
talent_profiles	Public/business profile object; can exist before claim
client_profiles	Client/company-facing data
guest_sessions	Temporary lightweight client identity for saves and inquiries
media_assets	Original files, derivatives, crop metadata, ownership, approval, watermark state
talent_types	Primary/secondary talent taxonomy
tags	Traits and descriptors
skills	Structured capabilities
event_types	Work/job types
industries	Business contexts
fit_labels	Best-for labels used in matching and presentation
languages	Structured language taxonomy
locations	City/country/region normalized records
profile_revisions	Pending user-submitted changes awaiting review

favorites_saved_list	Guest/client saved talent items
inquiries	Agency-controlled request records
collections	Curated groups for homepage and merchandising
collection_items	Ordered talent membership within a collection
notifications	In-app event notifications
activity_log	Audit trail across entities and actions
settings	Global platform/media/watermark/notification/search settings

26. Technical Architecture and Infrastructure

- Application framework: Next.js App Router. Use route groups for public, auth, dashboard, and API organization.
- Authentication: Auth.js-based Google + email/password strategy is recommended, with framework-specific auth config in a dedicated auth.ts-style module.
- Database: Postgres for relational data, integrity, and reporting.
- Storage: object storage for originals and public derivatives; keep originals untouched.
- Image delivery: use optimized image delivery patterns and generated variants for card/profile/lightbox use cases.
- Environments: local, staging, production; keep media and secrets separated by environment.
- Background/event jobs: support media processing, email notifications, watermark generation, and analytics event processing cleanly.
- Use soft delete/archive by default for important entities instead of hard deletion.

For V1, the app should be built so it can run well with standard SaaS hosting patterns while remaining flexible about deployment provider. Separate database, object storage, and application secrets from the codebase. Staging should behave as a true review environment, especially for media, search, and approval workflows.

27. Performance, Caching, and Scalability

- Use infinite load on the directory UX, but keep APIs paginated under the hood.
- Optimize images aggressively with generated variants, lazy loading, CDN-friendly delivery, and cache invalidation when media changes.
- Use skeleton loaders and progressive card loading to keep discovery smooth.
- Design for hundreds to thousands of profiles and heavy image usage from day one.
- Separate public discovery queries from admin queries and from AI interpretation logic.

- Track key frontend events for analytics: AI search submit, filter applied, save clicked, quick preview opened, profile viewed, inquiry submitted, WhatsApp clicked, map location clicked.

28. Public Trust Signals and Privacy

- Support trust signals in the data model: verified_by_agency, approved_profile, active_listing, featured_talent, private_talent_later.
- Expose only the most helpful signals publicly; avoid clutter.
- Support Public / Hidden / Private visibility modes.
- Clients should never see direct talent contact data.
- Support later consent/permission fields such as media usage consent and profile visibility consent if the business needs them.

29. Recommended UX Copy System

The full copy system can evolve, but these labels and helpers should be considered the baseline.

Area	Recommended copy
Homepage hero	Find the Right Talent for Your Event
Homepage helper	Describe what you need and we'll match you with the right talent.
Directory CTA	Search Talent
Card action	Save
Profile action	Add to My List
Inquiry CTA	Contact About These
Profile review CTA	Submit for Review
Client empty state	You haven't saved any talent yet.
Talent helper	Complete your profile to increase visibility.
Preview label	Preview Public Profile

30. Phased Delivery Plan

The build should be phased deliberately. This reduces risk, keeps QA manageable, and ensures the foundation is solid before AI or monetization layers become more advanced.

Phase 0 - Discovery and Architecture Lock

- Finalize product blueprint, UX direction, taxonomy seed lists, field schema, status model, collection model, and route plan.

- Choose hosting approach, database provider, object storage, auth provider setup, and environment strategy.
- Prepare design tokens, color system, spacing scale, and component inventory.

Phase 1 - Project Foundation

- Initialize Next.js App Router project, route groups, TypeScript, linting, formatting, env handling, and CI basics.
- Set up Postgres schema foundation, object storage integration, authentication groundwork, role/permission system, and settings model.
- Create multilingual foundation for English and Spanish labels.
- Set up skeleton app shell for public, auth, and dashboard sections.

Phase 2 - Core Data and Admin Foundations

- Implement users, talent_profiles, client_profiles, guest_sessions, locations, taxonomy tables, settings, activity log, and notifications.
- Seed taxonomies and controlled options.
- Build Super Admin basic navigation and overview shell.
- Implement soft delete/archive behavior and internal profile code generation.

Phase 3 - Authentication and Onboarding

- Implement Google login and email/password login.
- Implement first-login role selection for Talent vs Client.
- Build Talent onboarding starter flow, Save for Later, completion tracker, terms acceptance, and Submit for Review.
- Build admin-created profile flow, invite/claim flow, and reset/resend invite utilities.

Phase 4 - Talent Profile and Media System

- Build structured talent profile forms and field rendering by section.
- Implement avatar crop, banner crop, portfolio upload, drag reorder, media approval states, and talent/admin preview.
- Implement pending revision flow for talent edits and auto-approval for admin edits.
- Implement watermark settings and public derivative generation.

Phase 5 - Public Discovery Experience

- Build homepage hero, typed search placeholders, category shortcuts, featured sections, best-for sections, and admin-managed homepage sections.
- Build directory page with sticky filters, mobile filter drawer, cards, sorting, applied chips, infinite load, and quick preview.
- Build Save/Add to My List behavior and guest session persistence.

Phase 6 - Inquiry Cart and Client Flow

- Build floating inquiry cart, contact modal, WhatsApp message composition, inquiry storage, and agency-only routing.
- Build client dashboard: Saved Talent, Requests, Client/Business Info.
- Link guest session saves and inquiries into a real client account after registration.

Phase 7 - Admin Operations Expansion

- Expand Super Admin modules: Talent list/detail, Clients, Inquiries, Collections, Homepage, Media, Taxonomy, Fields, Settings, Notifications, Activity Log.
- Add featured_level, featured_position, collection ordering, and private/public controls.
- Add revision review tools and media moderation queue.

Phase 8 - AI Search V1

- Implement structured intent parsing over taxonomy and profile fields.
- Sync AI query interpretation with directory filters.
- Store raw and interpreted AI queries on inquiries and search events.
- Add Search Insights and AI Matching admin views.

Phase 9 - Polish, Performance, and QA

- Deep QA on mobile and desktop, image optimization, cache strategy, accessibility checks, skeleton states, helper text, validation, and empty states.
- Instrument analytics events.
- Validate multilingual labels, SEO metadata, canonical rules, and noindex behavior.
- Run content QA, moderation QA, role-permission QA, and load/performance testing.

Phase 10 - Launch and Post-Launch Roadmap

- Release public discovery, talent onboarding, client saves, agency inquiry handling, and admin operations.
- Monitor search terms, saved-talent behavior, inquiry conversion, and content gaps.
- Roadmap next: map split view, semantic/vector AI search, payments, private-talent client memberships, premium visibility, advanced analytics, and marketplace-grade workflows.

31. Known Blockers and Risks to Address Early

- Mixing account identity with talent profile ownership will create workflow pain later. Keep them separate.
- Allowing free-form taxonomy without governance will break filters, cards, and AI quality.
- Applying watermarks destructively to originals will hurt future flexibility. Use generated public variants instead.

- Publishing user edits directly without revision review risks profile quality and consistency.
- Building AI search before the structured schema is complete will produce a flashy but unreliable experience.
- Hard-deleting profiles, media, or inquiries will create operational and auditing problems later.
- Skipping multilingual architecture early will make English/Spanish support much more expensive later.
- Skipping analytics instrumentation will make ranking and conversion improvements much harder post-launch.

32. Definition of Done for V1

- Public users can search talent, filter, save talent, and send an agency request without friction.
- Talent can register, complete a profile gradually, upload/crop media, preview, and submit for review.
- Admin can create talent profiles manually, reorder media, preview, approve, feature, hide, archive, and manage homepage sections and collections.
- Client can have saved talent and request history tied to a dashboard or linked from a guest session later.
- The app supports English and Spanish labels cleanly.
- The media pipeline optimizes delivery, supports crop presets, and optional watermarking.
- The directory uses infinite loading, preserves sort/filter/search state, and remains performant.
- Workflow states, membership tiers, visibility, featured controls, and revisions all behave independently and correctly.

33. Recommended Build Order Summary

Priority	What to build first
1	Foundation: project setup, DB, auth, locations, taxonomy, settings, envs
2	Admin shell + core entities + profile code generation
3	Talent onboarding, completion tracker, submit for review
4	Media crop/reorder/approval/watermark pipeline
5	Homepage + directory + save list + quick preview
6	Inquiry cart + inquiry storage + client basics
7	Admin operational modules + ordering/feature controls
8	AI search V1 + analytics/search insights

9	Performance, QA, multilingual, SEO, launch hardening

34. Final Recommendation to the Developer

Build Impronta Models & Talent as a premium agency platform with structured data, strong admin operations, and a clean discovery experience. Keep the foundations relational and well-governed. Treat AI as an enhancer of structured discovery, not as a substitute for architecture. Make the public UI elegant and luxurious, but always practical. Prioritize clarity, performance, and future flexibility from the first commit.

End of blueprint.
